Outline:

1) Why are **Navier-Stokes** equations interesting for Theoretical Physics?

- Strongly non perturbative field Theory (Classical)
- Anomalous Scaling (Non-Gaussian Statistics)

2) Why do we need a model for Navier-Stokes?

3) Burgers' equation and Fourier Fractal Decimation

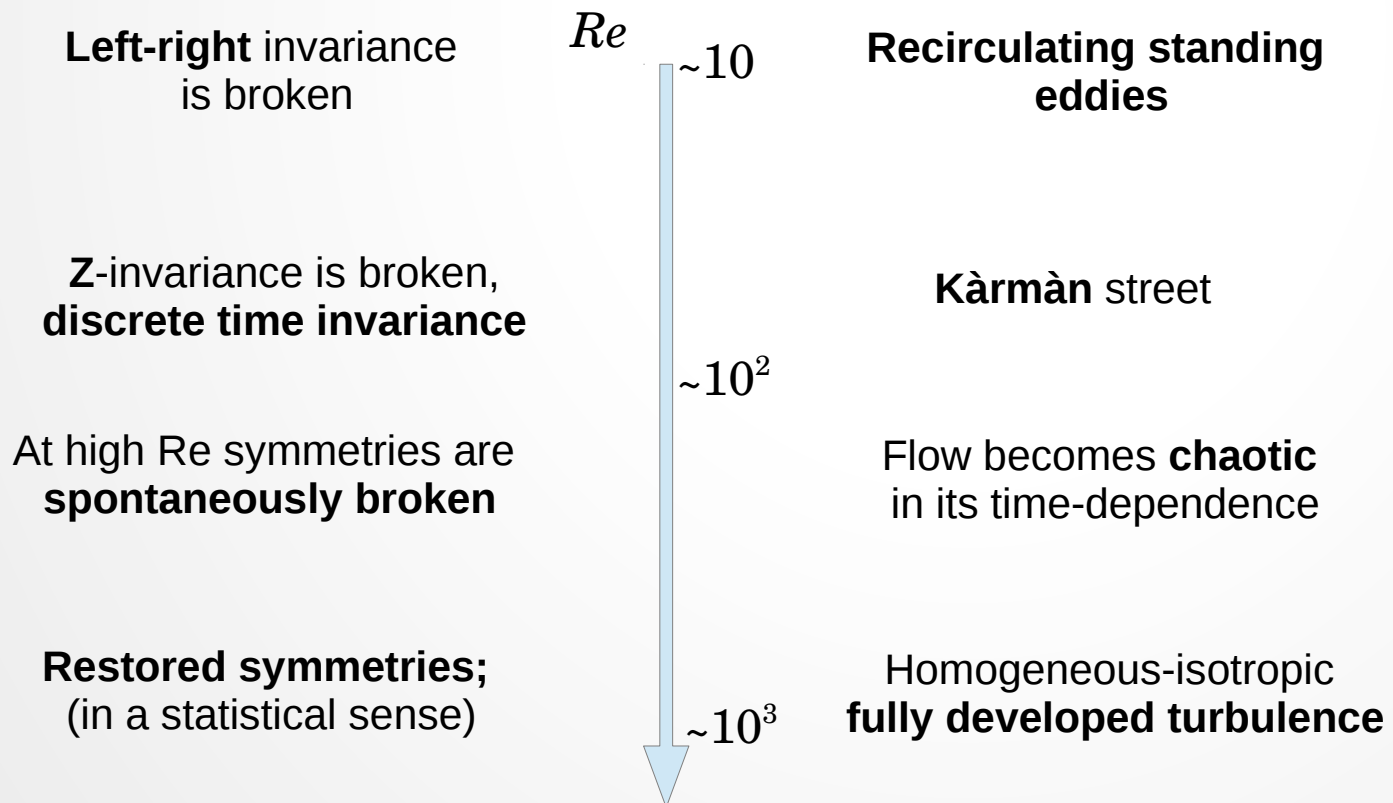

“With turbulence, it's not just a case of physical theory being able to handle only simple cases—we can't do any. We have no good fundamental theory at all.” (Feynman, 1979, Omni Magazine, Vol. 1, No.8).

Probabilistic description for fully developed Turbulence

Navier-Stokes, (N-S), equations:

$$\begin{cases} \frac{\partial \mathbf{v}(\mathbf{x}, t)}{\partial t} + \mathbf{v}(\mathbf{x}, t) \cdot \nabla_x \mathbf{v}(\mathbf{x}, t) = -\nabla_x p(\mathbf{x}, t) + \nu \Delta_x \mathbf{v}(\mathbf{x}, t) + \mathbf{f}(\mathbf{x}, t) \\ \nabla_x \cdot \mathbf{v}(\mathbf{x}, t) = 0 \end{cases}$$

$$\begin{cases} \hat{t} = t/t_0 \\ \hat{x} = x/l_0 \\ \hat{v} = v/v_0 \end{cases} \quad \partial_t \hat{v} + \hat{v} \cdot \partial \hat{v} = -\partial \hat{P} + \frac{1}{Re} \partial^2 \hat{v} \quad Re = \frac{l_0 v_0}{\nu} \quad Re \sim \frac{\hat{v} \partial \hat{v}}{\nu \partial^2 \hat{v}}$$

Anomalous Exponents, Small-Scales Intermittency

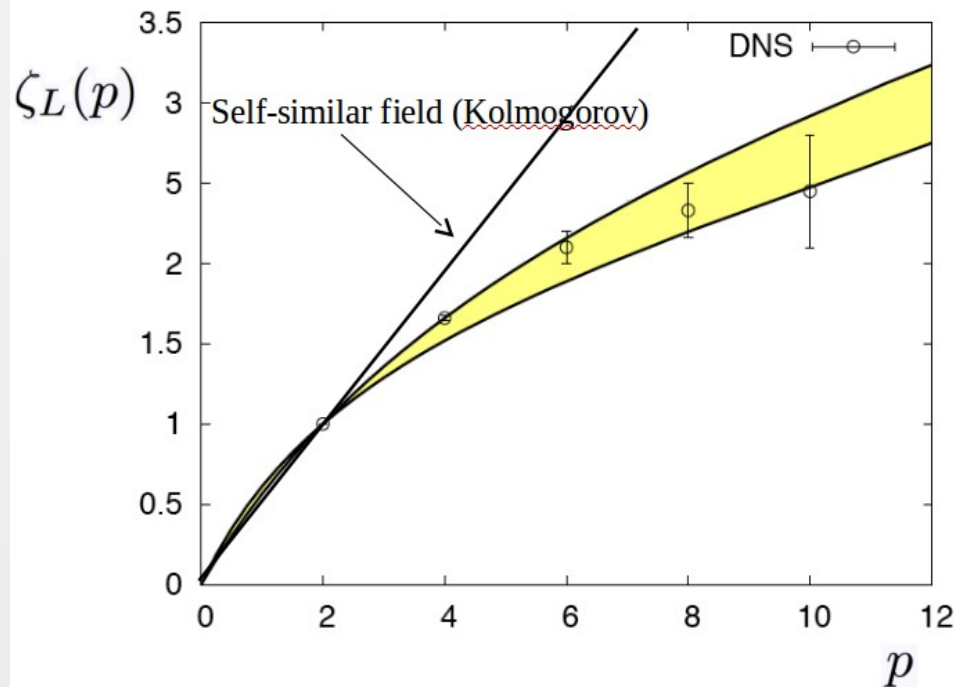

H1) Restored symmetries (in a statistical sense).

H2) Self-similarity at small scales.

$$S_p(r) = \langle (\delta_r v)^p \rangle \sim r^{\zeta_L(p)}$$

$$\delta_r v = v(x+r) - v(x)$$

Benzi, Biferale, Fisher, Lamb and Toschi, JFM (2010).

$$\delta_r \tilde{v} = \frac{\delta_r v}{\langle (\delta_r v)^2 \rangle^{1/2}}$$

..a model for Turbulence

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} = \nu \frac{\partial^2 u}{\partial x^2}$$

Burgers' equation

$u(t, x)$: velocity field, depending on a variable of time (t), and on a variable of space (x) | ν : kinematic viscosity

Burgers produces a singularity, (shock).

Lagrangian observation

$$\begin{cases} u(t, X(t, a)) = u_0(a) \\ X(t, a) = a + tu_0(a) \end{cases} ; J(t, a) = \frac{\partial X}{\partial a} = 1 + tu'_0(a) ; t^* = \frac{1}{-\text{inf}_a[u'_0(a)]}$$

Gradient in the Eulerian coordinates

$$\frac{\partial u}{\partial x} \Big|_{x^*=a^*} = \frac{\partial u}{\partial a} \Big|_{a^*} \frac{\partial a}{\partial x} \Big|_{x^*} = u'_0(a) \frac{1}{1 + tu'_0(a)} \rightarrow \lim_{t \rightarrow t^*} \frac{u'_0(a)}{1 + tu'_0(a)} = \infty$$

Intermittency on Burgers' equation

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} = \nu \frac{\partial^2 u}{\partial x^2} + f(x, t)$$

$$S_p(r) = \langle (\delta_r v)^p \rangle \sim r^{\zeta(p)}$$

how many degrees of freedom are related to the singularity?

..Reduce to learn!

FRACTAL FOURIER DECIMATION

$$u(x, t) = \sum_{k \in \mathbb{Z}} e^{ikx} u(k, t) \quad P_D \cdot u(x, t) = \sum_{k \in \mathbb{Z}} e^{ikx} \theta_k u(k, t)$$

$$\theta_k = \begin{cases} 1 & \text{with probability } h_k \\ 0 & \text{with probability } 1 - h_k, \quad k \equiv |\mathbf{k}| \end{cases}$$

$$h_k = (k/k_0)^{D-1}, \quad 0 < D \leq 1$$

The decimation is Random but Quenched on time,

leaving on average $N(k) \sim k^D$ active mode

Galerkin truncation projection: $k < k_{max}$

- Finite number of d.o.f.
- Fractal dimension

Frisch, Pomyalov, Procaccia, and Ray,
Turbulence in non-integer dimensions by
fractal Fourier decimation. Phys. Rev. Lett.
108, (2012)

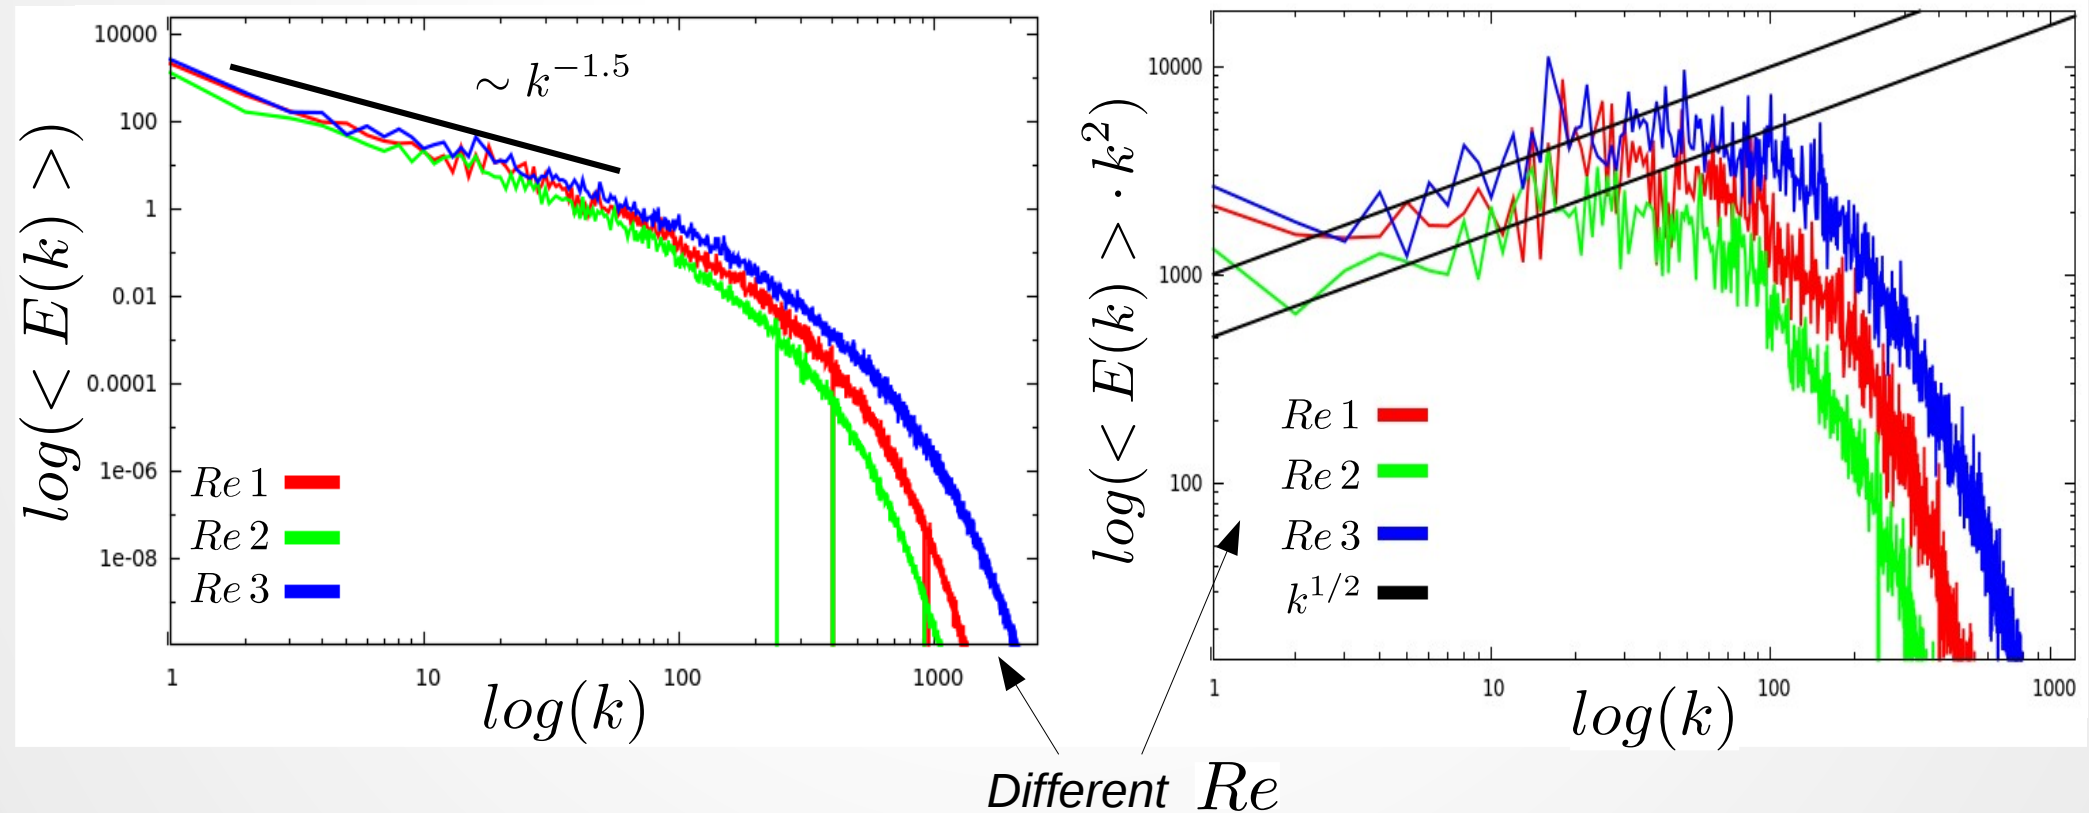

Decimated Structure Function

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} = \nu \frac{\partial^2 u}{\partial x^2} + f(x, t)$$

Mean spectra:

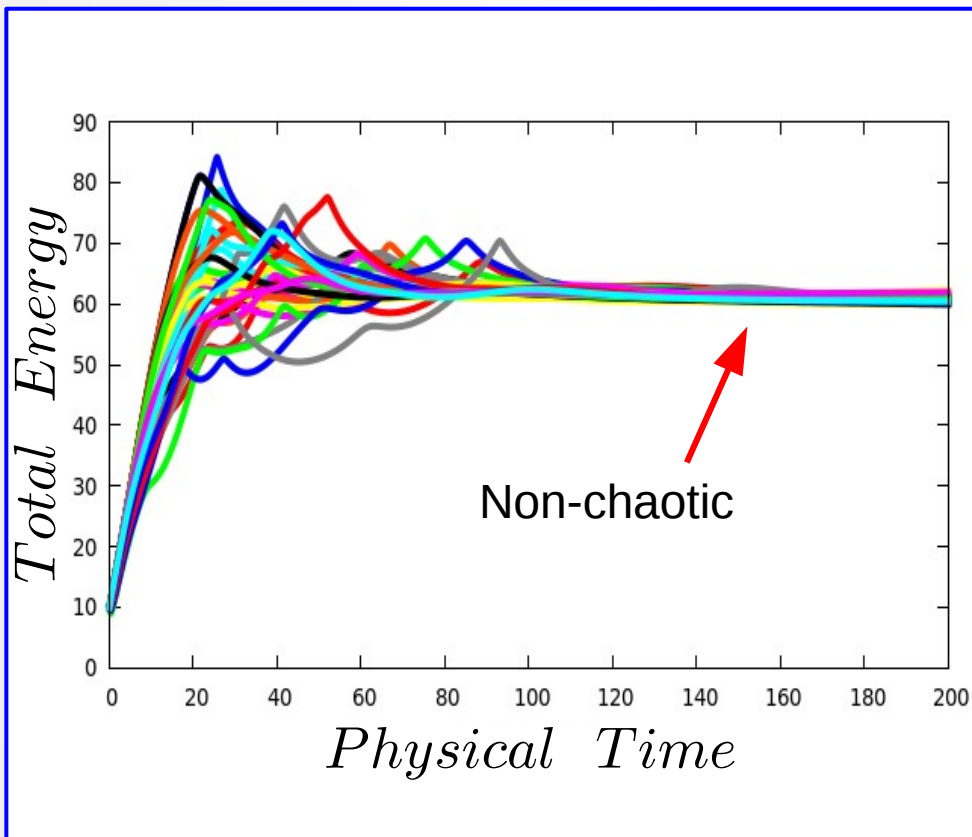

- 1° Averaged on time in the stationary state
- 2° Averaged on different decimation mask ($D = 0.95$)

Attractor differences (and properties ..?)

Different Initial Conditions:

Forced Burgers

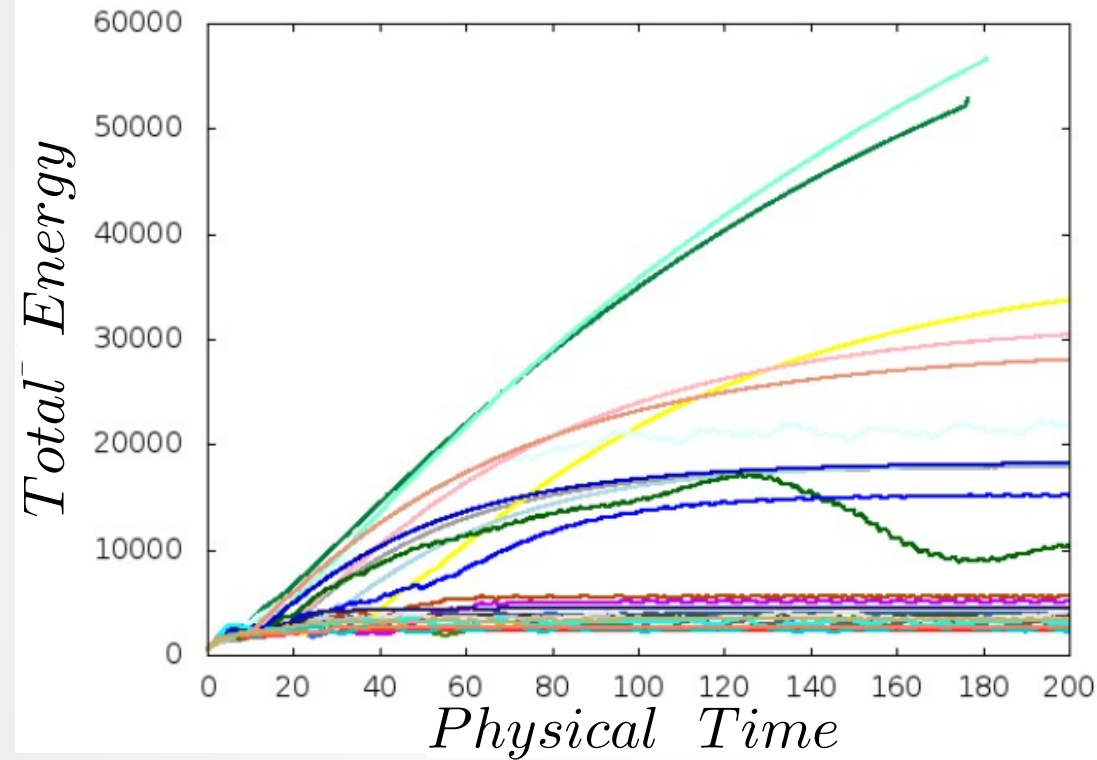

Forced Decimated Burgers
(same mask; $D = 0.95$)

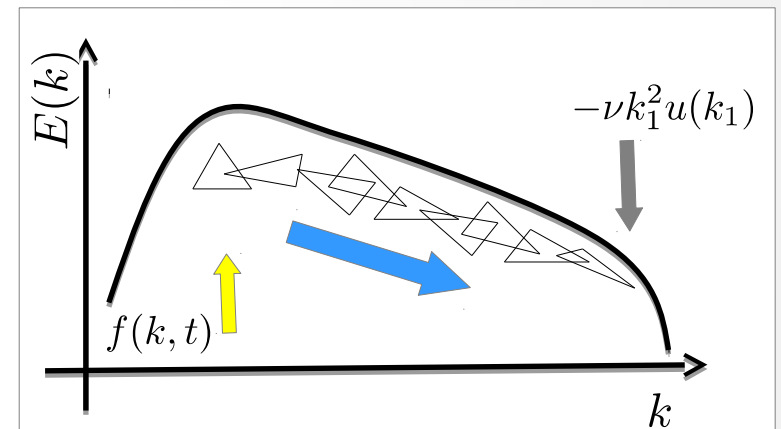

..Non Self-Averaging

Total energy evolution: **different masks**

$$\frac{\partial u(k_1, t)}{\partial t} = \sum_{k_2+k_3=k_1} \Pi(u(k_2), u(k_3)) - \nu k_1^2 u(k_1) + f(k, t)$$

Block in the energy transfer

Conclusions:

- 1) Differences in the statistics arise on changing the fractal dimension D
- 2) The system begins to be chaotic for D values very close to 1 ($D \sim 0.98$)
- 3) Non-Ergodicity
- 4) Problem of Non Self-Averaging

Intermittency on Burgers' equation

..BIFRACTAL MODEL

$$\frac{\delta v_\ell(r)}{v_0} \sim \begin{cases} \left(\frac{\ell}{\ell_0}\right)^{h_1}, & r \in \mathcal{S}_1, \dim \mathcal{S}_1 = D_1 \\ \left(\frac{\ell}{\ell_0}\right)^{h_2}, & r \in \mathcal{S}_2, \dim \mathcal{S}_2 = D_2 \end{cases}$$

$$\begin{cases} D_1=0 ; h_1=0 & \leftarrow \text{isolated shock} \\ D_2=1 ; h_2=1 & \leftarrow \text{smooth ramps} \end{cases}$$

$$\frac{\langle \delta v_\ell^p \rangle}{v_0^p} \propto \left(\frac{\ell}{\ell_0}\right)^{ph_1} \left(\frac{\ell}{\ell_0}\right)^{1-D_1} + \left(\frac{\ell}{\ell_0}\right)^{ph_2} \left(\frac{\ell}{\ell_0}\right)^{1-D_2}$$

$$\frac{\langle \delta v_\ell^p \rangle}{v_0^p} \propto \left(\frac{\ell}{\ell_0}\right)^1 + \left(\frac{\ell}{\ell_0}\right)^p$$

Probability to be within a distance l of the set \mathcal{S}
